1. Introduction

This guide is for everyone who logs into the DigitalPaani Hiring Master System (HMS) — HR/Admin, Hiring Managers, Leadership, and the Super Admin. It explains what the system does, what you personally can see and do based on your role, and how to carry out the tasks you're responsible for, step by step.

HMS replaces what used to be scattered Google Forms, spreadsheets, and manual resume screening with one connected system: role requisitions, candidate applications, AI-assisted resume scoring, interview scheduling and feedback, and hiring decisions all live in one place, with a clear trail of who did what and when.

The hiring flow, end to end

Every hire moves through the same basic sequence, though different people are responsible for different steps:

1. A hiring requisition is submitted — typed directly into HMS by HR, requested by a Hiring Manager or Leadership, or via the Requisition Google Form, which creates the role automatically as a Draft.
2. HR/Admin, Leadership, or Super Admin reviews it and approves it (the Approve Role button, or Change status → Approved) — a Hiring Manager can no longer approve even their own requested role. Approval automatically generates a long-form Job Description PDF and a social-media-ready sharable, in about 20–30 seconds.
3. The role is posted (Live – Sourcing) and candidates apply, either added by HR directly or through the Job Application Form. Where the Sourcing module is switched on, HR also activates a sourcing plan for the role, so every channel is executed and tracked (section 4.9).
4. Every new application starts at the Applied and Screened stage. The instant it's created, HMS's AI scoring engine ("ResumeIQ") automatically reads the candidate's actual resume and scores it against the role on 8 dimensions — no manual step triggers it.
5. A reviewer reads the AI score and decides: Shortlist (which now means advancing straight from Applied and Screened to Interview Round 1 — open to every persona, not just HR/HM), Hold for Future, or Reject.
6. Candidates who are shortlisted go through interview rounds and/or a take-home assignment, each with structured feedback capture, then (where required) a reference check. A genuinely positive round of feedback now automatically advances the candidate to the next stage the moment it's submitted — there's no separate manual step for that.
7. HR manages the offer and joining process through to the candidate joining: the stages from Reference Check to Joined are moved by hand in HMS, while the offer letter and the pre-joining documents are prepared outside it.
8. Once a role is eventually closed — Filled or Cancelled — a one-page retrospective summary becomes available to download, covering the whole pipeline's history.

Good to know: This document describes the system as it exists today. A handful of small, known gaps are called out honestly where relevant, rather than glossed over — look for the "Good to know" notes throughout.

How to use this guide

Section 4 walks through every module/page in HMS — what it's for, who can use it, and how to do the main tasks in it. If you only want a condensed cheat-sheet for your own role, skip straight to Section 5 (Persona-by-Persona Quick Reference) and refer back to Section 4 for detail as needed. Section 6 is a glossary of terms and ID codes you'll see throughout the system, and Section 7 answers the questions people ask most often.

2. Getting Started

Logging in

HMS uses Google Sign-In only — there is no separate username/password to remember.

1. Go to the HMS login page and click “Sign in with Google.”
2. Use your @digitalpaani.com Google account — it must be the exact email address your HMS account was created with.
3. If Google asks you to authorize the app, approve it. This is normal on your first sign-in.

Good to know: Your account must already exist in HMS before you can sign in — Google sign-in never creates a new account by itself. If you see “Your account is not registered in HMS,” it means nobody has added you yet: contact the Super Admin (Aaron Newton) to have your account created first. Only an @digitalpaani.com email will ever be accepted — personal Gmail accounts are rejected outright. The sign-in screen’s own error message may say to ask HR; in practice only the Super Admin can create accounts. The same message appears if your account exists but has been deactivated.

Staying signed in

Your login session lasts 24 hours. After that, you’ll simply be asked to sign in again — nothing is lost, and there’s nothing to configure. Signing out is instant and only clears your session on that device; it doesn’t affect anyone else. One exception to the 24 hours: HMS checks on every request that your account is still active, so if the Super Admin deactivates it you are sent back to the sign-in page on your next click or page load (within about 15 seconds at most), even though your 24 hours have not passed. Reactivating the account lets you sign in again.

Finding your way around

The left-hand menu lists, in order: Dashboard, Roles, Sourcing (only while the Sourcing module is switched on), Active Candidates, Archived Pipeline, My Tasks, Agencies (HR/Admin, Leadership and Super Admin only), User Management (Super Admin only) and Help / FAQ. Your role is shown at the bottom of the menu. Every page is described in Section 4. The Help / FAQ page answers the same kinds of questions in short form and links to this guide and to the Hiring SOP.

Using HMS on a phone or tablet

On a phone or tablet (any screen narrower than a laptop) the left-hand menu is hidden behind a menu button at the top left of the page: tap it, pick a page, and it closes again (tapping outside it, or pressing Escape, closes it too). Wide tables may need sideways scrolling. HMS can be added to a phone or computer home screen like an app, but it still needs an internet connection — nothing is kept offline, so no candidate data stays on the device. On an iPhone, open HMS and sign in from the normal browser: Google sign-in inside the installed home-screen icon has not been confirmed to work.

3. Roles & Personas in HMS

Every HMS account is assigned exactly one of four personas. Your persona determines what you see and what actions you can take — it's set when your account is created and can only be changed by the Super Admin.

Persona	Who typically holds it	In one line
HR / Admin	The recruiting team	Full operational control of the entire hiring pipeline, every role and candidate.
Hiring Manager	The person a role reports to	Reviews AI-scored candidates and can shortlist (Applied and Screened → Interview Round 1) on any role — this specific action isn't ownership-scoped, and is open to every persona, not unique to Hiring Managers. Sees compensation figures for their own role's candidates only; submits feedback for rounds they're specifically listed on; can request a new role but cannot approve any role, including their own.
Leadership	Senior leadership	Sees and can do everything HR/Admin can — their permissions are deliberately identical — with narrower defaults: My Tasks → "Ready for review" shows Leadership only Founder-Review-flagged candidates (plus the candidates of any role they are themselves the named Hiring Manager of). Leadership, with the Super Admin, also changes the Sourcing module's settings.
Super Admin	Exactly one person (currently Aaron Newton)	Everything Leadership can do, plus the exclusive ability to add, edit, or deactivate user accounts. Unlike Leadership, Super Admin's My Tasks "Ready for review" stays unfiltered and company-wide, like HR/Admin's, and Super Admin also has the Sourcing box in My Tasks.

Three things that are true everywhere in HMS

1. **Financial and compensation data is scoped, not blanket-hidden.** CTC bands, expected CTC, agency fees, offer figures, and internal risk notes are visible everywhere to HR/Admin, Leadership, and Super Admin. A Hiring Manager sees candidate and application compensation (current and expected CTC, the Over Budget badge) **only** for a role they own; the role's own CTC Band field is shown to HR-tier users only. For any other role's data, a Hiring Manager sees these fields hidden.

2. **Access control is mostly "hidden buttons," not locked doors — with one exception.** Almost every page in HMS is reachable by any signed-in user; the system simply hides the buttons and links that don't apply to your persona, and double-checks every action on the server regardless of what the page shows you. The one true exception is User Management, which is the only page in HMS that actively redirects anyone who isn't Super Admin away from it.

3. **A Hiring Manager's Dashboard is locked to their own role(s), full stop.** Every KPI, chart, and filter on their Dashboard reflects only the role(s) they own — there's nothing to widen or clear, unlike the fully adjustable

Role filter HR/Admin, Leadership, and Super Admin get. This is enforced by the server itself, not just hidden in the interface.

Good to know: Interview-feedback rights work by round, not by persona: whoever is specifically listed as a round's interviewer (an exact email match on that round) can submit feedback for it — anyone, regardless of persona. If a round has no interviewer specifically assigned (normal for Assignment rounds), feedback on it is open to anyone at all. HR-tier users can submit feedback on any round.

4. Platform Modules — Feature Walkthroughs

This section covers every page in HMS in the order you'd normally encounter them: the Dashboard overview, Roles, Candidates, the resume-scoring and shortlist workflow, Archived Pipeline, Interviews/Assignments/Reference Checks, Agencies, and User Management, and the Sourcing Execution & Accountability module.

4.1 Dashboard

The Dashboard is the single-screen answer to "what needs my attention right now, and who owns it." It rolls up open-role counts, candidate pipeline health, and SLA compliance into one filterable view that refreshes automatically — and, for a Hiring Manager, is always scoped to just their own role(s).

Who can access this

- Every persona sees the same page layout and the same charts/tables.
- HR/Admin, Leadership, and Super Admin see company-wide data by default, adjustable with the master filters.
- Hiring Manager sees the exact same sections, but every one of them — KPIs, charts, filters — is locked to their own open role(s) (see Section 3). There's no Role filter to change; a "Locked to your role" badge appears in its place.

Key things to understand

The three KPI cards — each shows one headline number plus four supporting figures:

- **Roles Snapshot** (the first card) — open roles, meaning roles currently Live – Sourcing, Approved, or Under Review (Draft, On Hold and Closed roles are not counted here), plus how many are P0 or P1, the average age of an open role, the average time from a role's Open Date to an accepted offer, and how many roles were filled in the last 30 days (shown as N/A whenever a master filter is on).
- **Active Candidates** — every application still Active (a candidate with two applications counts twice; the Active Candidates page itself also lists Hold for Future, Joined and Closed applications, so it shows more), plus how many have a Fit score (the ResumeIQ average × 10, out of 100) of 75 or more or of 45 or less, how many currently sit at Interview Round 1 or later, and how many candidates are unmatched — people with no application to any role yet (Job Application Form submissions whose role did not match, and candidates added directly and never linked); N/A whenever a master filter is on.
- **SLA Breaches** — total open breaches, split into how many belong to HR/Admin versus Hiring Manager, plus the single most common breach type and pipeline stage right now. For a Hiring Manager this card counts only breaches assigned to them; the sections below show every breach on their roles.

Hiring Funnel Snapshot — replaces what used to be a "Pending Actions by owner" board. An interlocking chevron strip, one segment per pipeline stage, shows how many open SLA breaches sit at each stage (one per overdue task, not a headcount). Click any stage to see which breach types are open there and who is overdue on each candidate; three owner buttons — All owners, HR/Admin and Hiring Manager — refine the section. Role is not a filter local to this section: it inherits the Role filter from the master filters above, like every other section.

SLA breaches by role — the same open breaches grouped by role instead of by stage: one stacked bar per open role (the eight with the most breaches, or all of them with Show all), longest first, split into five funnel steps from Applied & Screened to Reference → Offer, each a darker blue the further along it is. Click a bar for the stage-by-stage split with each breach type and who owns it; Table shows the same numbers as rows. It follows the master filters (not the owner buttons — it always counts both HR and Hiring Manager breaches),

and a Hiring Manager sees only their own roles. Breaches on roles that are not open (closed, cancelled or still a draft) are not drawn; a note under the chart says how many there are.

Aging Roles — a table listing every role currently Approved, Live – Sourcing, or On Hold, sorted red-first. Each row shows its own days-open figure and an aging status: red or yellow the further overdue against its own **Close Target** (yellow, then red, at 10 and 23 days past the Close Target for P0, 15 and 45 for P1, 30 and 68 for P2, 30 and 90 for P3), or green/OK if it's on track. A role with no Close Target set yet falls back to flagging on days-since-approved instead, and its row reads "N d open · no target" rather than a days-over figure. An On Hold role always shows OK — the clock isn't running while a role is paused — but it's still listed here for reference, not hidden. A role that's Draft, Under Review, or Closed never appears in this table at all. A red ! next to a role's name means no candidate on that role has had real movement — a stage or status change, feedback — for more than 3 days (new applications and automatic scoring do not count).

Hiring Funnel (the bar chart) — where every application sits right now. Each application is counted once, at its current stage — a candidate who has moved on is not counted at earlier stages. The bar shows Active candidates at that stage; the small text beneath counts those Rejected, Withdrawn or put on Hold for Future while at it (their stage freezes where it happened). Joined applications are not shown, so the Joined bar stays at 0.

Source Quality & Low Pipeline Roles — Source Quality shows Pass Rate (% that ever reached Interview Round 1 or later), Hire Rate (% that ever reached Offer Accepted or later), and % contribution per sourcing channel, computed over all-time history from each candidate's own Source (Naukri/IIMjobs, LinkedIn, Internal Referral, Agency, or Direct Outreach). Candidates who arrived through the Job Application Form are recorded as LinkedIn, so that channel includes every form applicant. Low Pipeline Roles lists open roles (Approved, Live – Sourcing, Under Review or On Hold) with fewer than 3 shortlisted candidates AND fewer than 8 Active candidates in the pipeline — a signal that sourcing, not process, may be the bottleneck. Those two columns decide who is listed; the scored-above-60 columns beside them are for information only.

Operational Velocity — turnaround time by stage (sorted slowest first, so the top bar is literally where time is being lost), the Interview→Offer ratio, and the biggest drop-off stage, shown both by raw rejection count and by rejection rate, since the two can point at different stages.

Master filters — Department, Location, Recruitment Mode, Priority, and Role — apply any combination and every section on the page recalculates together, so nothing on screen ever disagrees with anything else. A Hiring Manager gets the same filters except Role, which is replaced by a fixed "Locked to your role" badge. Filters are remembered per browser tab and reset in a new tab.

"i" icons everywhere — nearly every metric, chart, and section header now has a small (i) next to it. Hover it (or tap it) for a plain-English explanation of exactly what it counts and how, right where you're looking — including a full breakdown of every named SLA breach type next to the SLA Breaches card.

Sourcing execution — the last section on the page, shown only while the Sourcing module is switched on: a summary of active plans, tasks done on time and overdue, and a table of sourcing exceptions across roles. Click a role in the table to open that role's whole plan on the Sourcing page (in the sidebar, section 4.9). A Hiring Manager sees it for their own roles only, read-only.

Step by step

Read your Dashboard at a glance (all personas)

1. Check the three KPI cards first — a red SLA Breaches figure or a big jump in an unfamiliar sub-metric both mean something's worth a closer look.
2. Open the Hiring Funnel Snapshot and click any stage showing a breach count to see exactly who's overdue and why — hover the (i) icon next to SLA Breaches first if you're not sure what a given breach type means.
3. Check Aging Roles — every Approved/Live – Sourcing/On Hold role is listed; look for anything shaded red (overdue) or yellow (approaching). On Hold roles are listed for reference but never flagged.

4. If you're HR/Admin, Leadership, or Super Admin, use the master filters at the top to scope the whole page to a department, location, or specific role. If you're a Hiring Manager, everything on the page is already scoped to your own role(s) — there's nothing to adjust.

Good to know

- The Dashboard is more than a passive report — opening it is literally what keeps SLA-breach data current behind the scenes, so it's worth checking regularly rather than only when something already looks urgent. The KPI cards and most sections refresh themselves every 5 minutes (the Hiring Funnel Snapshot updates only when you reload the page or come back to it), and SLA data is recomputed when the page loads, at most once every 3 minutes on each server.
- Clicking into a breach candidate's card in the Hiring Funnel Snapshot takes you straight to their profile — there's no "mark as done" button on the Dashboard itself; resolving the underlying item (e.g. submitting feedback, advancing the candidate) is what clears it automatically.

4.2 Roles (Requisitions)

This is where every open position is created, approved, and tracked from first requisition through to closure. Every candidate and application in HMS is ultimately linked back to a role here.

Who can access this

- HR/Admin and Super Admin create roles with the New role button, and Leadership with Request role (the same kind of Draft); all three can edit any field and change any role's status (which includes approving it).
- Hiring Manager can submit a role request — the button reads "Request role" instead of "New role," but creates the same kind of Draft. They can view every role's pipeline but can no longer approve any role — including their own. Any attempted edit or status change by a Hiring Manager to any role now returns an error; approval, and every other change, is HR-tier only (HR/Admin, Leadership, Super Admin).

Key things to understand

Status lifecycle — Draft → Under Review → Approved → Live – Sourcing → On Hold → Closed – Filled / Closed – Cancelled. HR/Admin, Leadership or Super Admin approves a role with the Approve Role button on the role page (shown for Draft and Under Review roles) or with Change status → Approved; a Hiring Manager attempting it, even on their own requested role, is blocked. Statuses are set by hand and in any order: nothing moves a role from Approved to Live – Sourcing for you, so set it when sourcing starts — Add candidate, Add Application, Link to role and Reactivate offer only Live – Sourcing roles (candidates applying through the Job Application Form are linked to any role that is not closed).

Three ways a role gets created — Manually by HR filling in the New Role form, requested by a Hiring Manager or Leadership via "Request role" (same Draft-creation flow, HR still reviews it), or automatically from the Requisition Google Form (arrives as a Draft, usually sparser, and always needs an HR review pass).

Automatic JD generation — The moment a role's status is set to Approved, HMS automatically generates two PDFs — a full long-form Job Description and a social-media-ready sharable — using AI to condense the role's requirements into polished copy. This takes roughly 20–30 seconds while the status change is saving; the links appear under "Links & Assets" once ready.

Priority (P0–P3) — drives both the aging-alert thresholds and how urgently a role should be sourced — P0 is the most time-sensitive.

Open Date is set automatically, at approval — the moment a role's status actually becomes Approved, HMS stamps that day as its Open Date; it's never a field you type in yourself, at creation or afterward. Role Age is measured from that date, so it always tracks "days since approved," never "days since this form was filled in." The acting approver's name and the approval date are recorded automatically at that same moment and shown on the role's detail page. A later move back into Approved (for example from On Hold) stamps a fresh Open Date, so Role Age starts again; moving on to Live – Sourcing does not.

Aging is tied to each role's own Close Target, not simply how long ago it opened. Set a realistic Close Target when approving a role; pushing it out later genuinely clears an aging alert, rather than the system assuming the original plan was wrong. An aging alert only ever appears while a role is Approved or Live – Sourcing — an On Hold role is always shown OK in the Aging Roles table (still listed, just never flagged), and a Draft/Under Review role doesn't appear there at all yet.

Role Closure Summary — once a role reaches Closed – Filled or Closed – Cancelled, a "Download Closure Summary" button appears on its detail page: a one-page PDF retrospective covering the whole pipeline funnel (every candidate who was ever in it, not just who's currently active), every SLA breach type and count the role accumulated, source-channel quality, and how long the role actually took to close.

Roles with several Hiring Managers — HR lists everyone in the role's Hiring Manager field as "First Last, First Last" (a comma, semicolon, ampersand or the word "and" separates people; write names First Last, never "Last, First"). Each person is matched by whole name, ignoring case, against their HMS user name — "Amit" does not match "Amit Gosain" — and each gets the Hiring Manager view of that role. Saving shows a warning for any name that matches no HMS user.

Discard a role — a Draft role with no applications can be discarded by HR/Admin, Leadership or Super Admin; it is permanently deleted and the discard is logged. This is how a Hiring Manager's role request is declined; the requester is not notified.

Sourcing plan — where the Sourcing module is switched on, a role's page shows a small Sourcing chip (for example "Sourcing: 2 issues") that opens the role's plan on the Sourcing page (section 4.9). The role's Recruitment Mode field becomes read-only once a plan exists.

Step by step

Create a new role (HR/Admin, Leadership, Super Admin — or Hiring Manager, as a request)

1. From the Roles page, click "New role" (or "Request role," if you're a Hiring Manager or Leadership).
2. Fill in Basic Information (title, department, hiring manager, priority, openings, location, employment type, Target Close Date), Requirements/Description (must-have and nice-to-have skills, job description), and Sourcing (which recruitment channels to use).
3. Submit — you'll land directly on the new role's detail page, created as a Draft.

Review and approve a role (HR/Admin, Leadership, Super Admin only)

1. Open the role (broaden the Status filter on the Roles page if it's still a Draft — the default view only shows Approved and Live – Sourcing roles).
2. Review and edit any section inline as needed — Basic Info, Requirements, Description, Dates, Approval, and Links & Assets each save independently.
3. Set a realistic Close Target while you're here — this is what drives the role's aging alerts from now on. Its Open Date is stamped automatically the moment you confirm the approval below — there's nothing to fill in for that.
4. Click Approve Role (shown for a Draft or Under Review role) — or Change status, choose Approved, and confirm.
5. Wait for the confirmation — this step runs the automatic JD generation, so it can take up to half a minute. Once complete, the long-form and social JD links appear under Links & Assets, and your name and today's date are stamped as the approver.

Download a role's closure summary (HR/Admin, Leadership, Super Admin)

1. Once the role's status is Closed – Filled or Closed – Cancelled, open its detail page.
2. Click "Download Closure Summary."
3. A one-page PDF opens with the full retrospective — pipeline funnel, SLA breaches, source quality, and time-to-close.

Good to know: If JD generation fails for any reason, the role's status change still goes through — it just won't have JD links yet. Saving the role again does not retry it: generation runs only when a role moves into Approved with no JD on file. To retry after a failure, move the role out of Approved and back in. While the role is still Approved and a JD exists, HR can use Regenerate JD (it overwrites both PDFs); once the role is Live – Sourcing it is no longer offered. A failure message appears when you approve with Change status but not when you use Approve Role, so check that the JD links appeared. Moving the role out of Approved and back in also records you as the approver and sets the Approval Date and Open Date to today, which restarts its Role Age.

Good to know

- The Roles list defaults to showing Approved and Live – Sourcing roles — if you're looking for a Draft, Under Review, On Hold, or Closed role and can't find it, clear or broaden the Status filter first.
- The search box only searches whatever roles your current filters are already showing — it can't find a role your filters are hiding.
- Age, Active Candidates, and Active Shortlist column headers on the Roles list each have an (i) icon explaining exactly what's counted — Active Shortlist specifically counts applications currently at Interview Round 1, Interview Round 2, Assignment Round, or Founders Round.
- The role's CTC Band, the Salary Range column and the Run benchmark button are shown to HR-tier users only; a Hiring Manager sees compensation for candidates on their own role, not the role's band.

4.3 Candidates & Applications

This is the core day-to-day pipeline screen: every candidate's profile, and every application (a candidate's connection to a specific role) with its own independent tracking.

Who can access this

- HR/Admin, Leadership, and Super Admin have full read/write access — adding candidates, editing profiles, and moving applications through every stage and status.
- Hiring Manager sees candidate and application data with financial fields removed — unless the candidate is linked to their own role, in which case those fields show normally. Either way, there are no add/edit/bulk-action controls here; a Hiring Manager's ability to act on a candidate comes from Scorecard Summary and My Tasks instead (see 4.4).

Key things to understand

Candidate profile vs. Application — A candidate is one person, tracked once (contact details, CTC, resume, experience). An application is that person's connection to one specific role — a candidate can have several applications if they're being considered for more than one role at once.

Three independent tracking fields, every application — Stage (their position in the pipeline — 11 possible values: Applied and Screened, Interview Round 1, Interview Round 2, Assignment Round, Founders Round, Reference Check, Pre-Joining Documents, Offer Discussion, Offer Released, Offer Accepted, Joined), Status (Active, Rejected, Withdrawn, Hold for Future, Joined, or Closed), and a Recruiter Screening Status label that is shown on the candidate and role pages but cannot be changed from any screen today.

Three checks before certain stage moves — HMS won't let anyone move a candidate forward while any of their scheduled interview/assignment rounds still has feedback outstanding, and won't let anyone leave the Reference Check stage until at least one reference check is on file. The third: moving a candidate to Interview Round 1 when the expected CTC is 15% or more above the top of the role's band needs a recorded over-budget reason (see 4.4). The first two cannot be skipped from the screens.

Rejecting or withdrawing always needs a reason — a reason category is mandatory whenever a candidate is Rejected or Withdrawn. A rejection takes one or more reasons (tick every one that applies, for example "Missing mandatory skill" and "Compensation mismatch"); a withdrawal takes a single reason. When rejecting, an optional draft e-mail to the candidate is offered, sent from hr@digitalpaani.com in the same action; it never names the internal reasons, and when several are ticked it uses one neutral wording. Leaving it unchecked just rejects the candidate with no e-mail. If the candidate has no e-mail address on file, or the send fails, they are still rejected and a warning appears on their application.

A candidate's applications are expanded by default — opening any candidate's profile now shows every application section already open, with interview rounds, notes, and stage/status controls visible immediately rather than needing a click to reveal them. Company / Industry is shown as one merged column, and an Application Date column shows how many days ago the candidate applied; click the Fit, Application Date, or Last Updated column headers to sort by that column (click again to flip direction).

What is on a candidate's page — The top shows contact details, HR tags and a pipeline progress bar for each application. On the left are Identity (including Source, and the agency when the Source is Agency), Current Role, Compensation and Resume & Tags; each has a pencil to edit it, but only HR/Admin, Leadership and Super Admin can save changes. On the right, Applications lists each role with its stage, status, SLA tag, Founder star and ResumeIQ score, with the interview rounds, reference checks, the ResumeIQ result, the candidate's own answers from the application form and HR notes under each one; the Activity timeline at the bottom logs every change. Click a red Rejected tag to see the exact reasons logged. A "Screening & Risk Notes" panel appears on an application only if it already has notes: HR/Admin, Leadership and Super Admin

start one with + Add HR Screening Notes. A Hiring Manager cannot open that panel but does see the Recruiter Summary text on the application, so keep anything private out of that box.

What Active Candidates shows — up to the 100 highest-scoring applications from everything except Rejected and Withdrawn (those live in Archived Pipeline); Hold for Future, Joined and Closed applications are included unless you filter Status. Search runs on the server, so it finds candidates beyond the 100 shown. Sorting reorders only the rows currently visible. Fit is the ResumeIQ average out of 100, ten times the Average Score in Ready for review (a Fit of 74 is an Average Score of 7.4).

Gender tag — every candidate carries a best-effort Gender tag (M or F) worked out from their first name when they are added; a dash means HMS could not tell (unisex or unrecognised names are deliberately never guessed). It is a column on Active Candidates, Archived Pipeline and My Tasks → Ready for review, with Male, Female and Not tagged filters. It cannot be edited from the screens today.

Step by step

Add a new candidate (HR/Admin, Leadership, Super Admin)

1. Click “Add candidate” from the Candidates page.
2. Fill in Identity, the role they’re applying for, current role & experience, compensation, and their resume’s Google Drive link.
3. Submit — if the email address already exists in HMS, you’ll get a “Duplicate” message naming the existing candidate’s ID (C####) instead of a second profile being created. Everything on the form is required except LinkedIn URL, designation and Source (if the Source is Agency, choose the agency too), and its role list offers only Live – Sourcing roles.
4. On success, a candidate profile and their first application (starting at Applied and Screened / Active) are both created together — this is also the moment ResumeIQ scores their resume automatically (see 4.4), so expect a short pause here.

Move a candidate through the pipeline (HR/Admin, Leadership, Super Admin)

1. Open the candidate — the relevant application is already expanded — and click Stage to change their pipeline position, or Status to mark them Active/Rejected/Withdrawn/Hold for Future. With one application the buttons sit at the top beside the candidate’s name; with two or more they sit on each application’s own row. Joined is never chosen from Status — it is set by moving the stage to Joined.
2. ResumeIQ scoring now happens automatically the moment a candidate/application is first created (see 4.4) — you won’t see a scoring pause here when simply changing an existing application’s stage.
3. If rejecting or withdrawing, choose a reason category (required) and optionally add detail.

Update several candidates at once (HR/Admin, Leadership, Super Admin)

1. Tick the checkbox on each candidate you want to update, or the header checkbox to select everyone currently shown.
2. Use the toolbar that appears to Change Stage or Change Status for the whole selection at once.
3. A summary toast reports how many of the selected candidates were updated successfully.

Reconcile candidates the system couldn’t automatically link to a role (HR/Admin, Leadership, Super Admin)

1. Open the “Unmatched Candidates (N)” panel above the table — it lists every candidate with no application to any role yet, whether a resume was added directly or a Job Application Form submission’s typed role did not match exactly one role that is not closed. Hover the (i) icon beside its heading for the details. The panel is hidden while a Role filter is active.
2. Click “Link to <role>” when a role with exactly the same title exists (capital letters, extra spaces and the kind of dash are ignored; a misspelt or renamed title is never matched), or “Link to role” to pick the role yourself — it lists only Live – Sourcing roles the candidate has not already applied to.

3. The trash icon on a row permanently deletes a candidate who has no application — use it only for duplicates or junk.

Good to know

- Rejected and Withdrawn applications never appear on Active Candidates — they are in Archived Pipeline (section 4.5), searchable and re-linkable. Nothing is deleted.
- “Add Application” (on a candidate’s own profile page) lets you apply someone already in the system to a second role without re-typing their profile.
- Only Active, Rejected, Withdrawn, and Hold for Future are ever manually selectable from the Status dropdowns — Joined is set by moving the stage to Joined, and Closed exists as a value but nothing sets it today.

4.4 ResumeIQ Scoring, My Tasks & the Ready-for-review Table

This is the heart of the review-and-shortlist workflow, and the one part of HMS every persona uses. The moment a candidate's first application is created, HMS's AI scoring engine — ResumeIQ — automatically reads their actual resume and scores it against the role, before they ever appear anywhere in the review queue. Anyone can then review that score in My Tasks → Ready for review and decide: Shortlist, Hold for Future, or Reject.

Who can access this

- My Tasks is in the sidebar for every persona. Its Ready for review table — the "Scorecard Summary" table, also reachable from a role's page through its Scorecard Summary button — is open to every persona. (There is no separate Scorecard Summary page.)
- The three review actions — Shortlist, Hold for Future, Reject — are available to everyone, on any candidate currently at the Applied and Screened stage. This is deliberate: it's not restricted to Hiring Managers specifically. Shortlist specifically means advancing that application straight to Interview Round 1.
- One small difference: the Stage badge in the Ready-for-review table is a clickable "jump to any stage" link for Leadership and Super Admin only; everyone else sees plain text there. (HR/Admin change a candidate's stage from the candidate's page.)
- Which candidates the table lists depends on your persona (see below).

Key things to understand

What triggers AI scoring — As soon as an application is created (at the Applied and Screened stage), ResumeIQ automatically fetches the candidate's actual resume text from Google Drive and scores it against the role's requirements — no separate button, and no stage change required. This happens once per application, ever, guarded so it can't double-fire. If automatic scoring failed for any application, HR/Admin, Leadership and Super Admin see a banner above the table ("N candidates without a ResumeIQ score …") with a Retry scoring button. A candidate that shows 0 in every dimension with the red flag "AI scoring returned invalid output — retry needed" is a different case: the AI's reply could not be read and the numbers mean nothing; Retry scoring does not list it, so tell whoever maintains HMS.

The 8 scoring dimensions — Technical, Experience, Industry Fit, Culture Fit, Role Alignment, Trajectory, Leadership, and Communication — each scored 0–10, averaged into one overall score, alongside a written verdict (Strong Yes / Yes / Maybe / No), key strengths, any red flags, and a short executive summary. Hover the (i) icon next to the Scorecard Summary page title if you ever forget what an abbreviated column (Tech, Ind, Traj, and so on) stands for. For two roles ResumeIQ adds a ninth dimension, Portfolio (0–10), from a separate review that takes a few minutes — so the overall score shows as provisional until it finishes, and HR can press Re-run. For the Senior UX/Product Designer role the portfolio links in the resume are opened in a browser and reviewed against the JD and the hiring manager's 15 criteria; a missing link scores 0 and a private or unreachable one 1 (3 when the only link is a PDF or slide deck, which is not opened — review it by hand), and these count in the average; a site that blocks automated viewing is not held against the candidate and is not scored, and if the resume could not be read the Portfolio dimension is left out. For the Head of Marketing & Creative Direction role the work the candidate linked in their application answer is reviewed instead (next two items), and work that cannot be reviewed is not scored.

The Portfolio review for Head of Marketing & Creative Direction — This review reads the work the candidate linked in their answer to "Links to public resources/portfolio to highlight your past work?" on the Job Application Form, not the resume. HMS opens each link the way a stranger would — it never uses HMS's own Google access, so a file that is not shared publicly cannot be read: Google Drive files, Docs and Slides, PDFs, Word and PowerPoint files, images, the candidate's own website, and Behance, Canva or Notion pages, up to eight links per application. YouTube and Vimeo links are judged from the title, description and thumbnails only — the video itself is not watched — an Instagram link from its public caption only, and

LinkedIn is never opened. The work is compared with the role's must-haves and nice-to-haves, and the review weighs how clearly the work is the candidate's own, how well its results are measured and how finished it is, as well as what it shows. The candidate's page shows the score with a confidence level (High, Medium or Low); the links HMS really read under "Work reviewed", each with a line saying how much of it was read ("Reviewed", "Partly", "Video … not watched"); every other link once under "Not reviewed — open these by hand", with the reason (for example "Not opened: social platform" or "Private or unavailable — ask the candidate to re-share"); "Based on N of M links", counting each web address once; any cap that held the score down, with its reason; and, collapsed, "How the evidence was checked". The review is not given the candidate's name, current title or years of experience and is instructed to judge the work only; it never comments on a person's age, gender, appearance or background.

When the Head of Marketing Portfolio is not scored — A blank or "N/A" answer, an answer that only describes the work in words, a link that is private or no longer exists, an answer with only LinkedIn, Instagram or video links, a site that blocks automated viewing, and work the review could not assess at all (unreadable, or in a language the review cannot judge) are not scored. Unlike the designer role, nothing is held against the candidate and no 0 is given: the Portfolio dimension is simply left out, the overall score stays the average of the other 8 dimensions, and the Portfolio review card on the candidate's page says why (for a text-only answer it shows the candidate's words as "Described by the candidate (unverified)"). For a private link, ask the candidate to re-share it so that anyone with the link can view it, then press Re-run. Videos, Instagram posts and everything on the "Not reviewed" list need a person to open them. Keep one consequence in mind when you compare candidates: a weak sample can lower a candidate's average, while a candidate whose work could not be reviewed keeps the average of the 8. If a Re-run finds nothing it can score while the candidate already has a Portfolio score, HMS keeps the earlier score and says so.

What the AI sees, and who decides — HMS uses AI to score resumes (ResumeIQ), review portfolios and work samples, write job descriptions and suggest sourcing steps. People make every decision: nothing in HMS moves, rejects or hires a candidate because of an AI score. A score is a starting point, though it does feed some timing rules — a ResumeIQ fit of 75 or more gives a tighter 24-hour window, and the Portfolio score is part of the average. ResumeIQ reads the resume, the profile fields (including the candidate's name) and the application answers. The designer portfolio review is also given the candidate's name, current designation and years of experience. The Head of Marketing work-sample review gets the name only as a placeholder, not the designation or years of experience, and it tries to remove personal details such as age or family status from what it reads, but it cannot guarantee that. The gender tag shown on candidate lists is never given to any AI review, and the sourcing next steps are written from counts only, with no candidate names or contact details. Check the evidence on the candidate's page before relying on a score.

The Ready-for-review table (Scorecard Summary) — a side-by-side table of scored candidates with their 8 dimension scores (plus Portfolio for designer and Head of Marketing roles), average and verdict, filterable by Role, Department, Location, Recruitment Mode, Priority, Status and Gender, with a search box, "In-budget only" (hides candidates whose expected CTC is more than 15% above the top of the role's band) and, for roles that get a portfolio review, "Portfolio ≥ 7.5" (portfolio scores are whole numbers, so that means 8 or more; candidates with no Portfolio score — including a Head of Marketing candidate whose work could not be reviewed — are hidden while it is on). It lists Active candidates by default, up to 500 (use the Status filter for others; an Applied and Screened candidate with no ResumeIQ score yet is still listed so it can be decided); only those at Applied and Screened have checkboxes and Shortlist/Hold/Reject buttons — later-stage rows are there for comparison. Click "View Highlights and Summary," centered under the score columns on any row, to read the strengths, red flags and write-up before deciding.

My Tasks → "Ready for review" is scoped by persona:

- HR/Admin and Super Admin see every scored, Active candidate company-wide, unfiltered.
- A Hiring Manager sees only candidates on the role(s) where they're the listed hiring manager.
- Leadership sees candidates flagged for Founder Review — plus, if they are also the named Hiring Manager of a role, that role's candidates. Use a role's Scorecard Summary button if you want to look at one role's full list.

The three actions — Shortlist moves the candidate's stage directly to Interview Round 1. Hold for Future changes their status to Hold for Future — a good profile, not right now, parked in Talent Pool for a future opening. Reject changes their status to Rejected, and always requires picking one or more reasons first (the optional e-mail to the candidate is offered here too). The over-budget reason (required when expected CTC is 15% or more above the top of the role's band — for every persona, including a Hiring Manager who cannot see the figures) fires whenever an application is advanced to Interview Round 1, regardless of its prior stage.

Acting on several candidates at once — Tick the checkbox on each candidate (or the header checkbox to select everyone reviewable at once) on either page — a toolbar appears offering the same three actions applied to your whole selection in one click.

The sections of My Tasks — a row of boxes, each with a count. Ready for review (above). Feedback Due: overdue interview and assignment feedback — a Hiring Manager sees the rounds they are a listed interviewer on, plus rounds on their own roles that list no interviewer; HR/Admin and Super Admin see everyone's. A third box depends on your persona: HR/Admin and Super Admin get Other Pending Actions (everything else that is genuinely theirs to resolve) with a separate Leadership Alerts panel for company-wide notices nobody individually owns (role-aging and compensation flags, the Feedback-Overdue escalation) — visible but not counted; a Hiring Manager gets their own Other Pending Actions; Leadership sees Leadership Alerts instead. HR/Admin and Super Admin also get a fourth box, Sourcing, when the Sourcing module is switched on (section 4.9). Feedback Due, Other Pending Actions and Leadership Alerts are filled from one shared list of the 100 highest-priority, oldest open items (so if they add up to about 100 there may be more behind them); Ready for review is separate and shows up to 500.

A Leadership user who is also a role's Hiring Manager keeps all of the above and additionally gets that role's Hiring Manager work — its candidates join Ready for review, its overdue shortlist decisions land in Other Pending Actions, and the feedback they personally owe on its rounds lands in Feedback Due — with a line at the top naming the role(s). It makes them a Hiring Manager of that role only: no Dashboard lock and no hidden compensation.

What the items in Other Pending Actions and Leadership Alerts mean — Resume Shortlist Pending: a candidate has waited at Applied and Screened beyond the window (the Hiring Manager's item). HM shortlist review: a candidate was shortlisted into Interview Round 1 — a heads-up for the role's Hiring Manager that nothing on screen completes; it clears by itself when the candidate's stage or status next changes. Interview 1, Interview 2 or Founders Round Not Scheduled and Assignment Not Sent: HR has not booked the round with a date or sent the assignment. Assignment deadline breached, Idle Candidate and Joining risk — no contact are described in the glossary. Founder Review: an application flagged for Leadership. Overdue feedback appears under Feedback Due instead. Leadership Alerts are notices of three kinds: Role aging alert (a role has reached red), Compensation change flag (a role's CTC band was edited) and Feedback Overdue — Leadership Escalation.

Founder Review flag — on a candidate's page, HR-tier users can click the star Founder chip on an application (with an optional note) to add the candidate to Leadership's Ready-for-review list and raise a Founder Review task; clicking it again clears it.

Step by step

Review and shortlist a candidate (any persona)

1. Open My Tasks → "Ready for review" from the sidebar — or from a role's page via its Scorecard Summary button, which opens it already filtered to that role.
2. Filter by Role first if you only care about one role. The list you see is scoped by persona as described above, so check the role name on each row before acting.
3. Read the AI write-up before deciding — click "View Highlights and Summary" on the row.
4. Click Shortlist to advance them, the pause icon/"Hold for Future" to park them for later, or the ✕/"Reject" to turn them down (you'll be asked for a reason).

Act on several candidates in bulk (any persona)

1. Tick the checkboxes next to the candidates you want to act on, or the header checkbox to grab everyone currently reviewable.
2. A toolbar appears showing your selection count and the same three action buttons.
3. Click Shortlist, Hold for Future, or Reject — for Reject, you'll pick the reason or reasons that apply to the whole batch, and the optional e-mail can go to each of them.
4. A summary toast confirms how many of your selection were updated.

Good to know

- Adding a brand-new candidate can visibly take up to 30 seconds — that's the AI genuinely reading and scoring their resume in real time at the moment of creation, not the page hanging. Changing an existing application's stage later never re-triggers this.
- If a candidate's resume link is broken or unreadable, scoring still completes using just their profile details, and the result is flagged so you know less information was available (the candidate's page shows a "No resume read" tag). This also covers an old .doc file, an image, a password-protected file and a file over 20 MB.
- The table is scoped by persona (see above) but never pre-filtered to one role for you — always double-check the role name on a row before acting on it.
- Leadership and Super Admin additionally get a clickable Stage badge ("jump to any stage") in the table, for exceptional situations outside the normal Shortlist/Hold/Reject flow — everyone else sees the stage name as plain text there.

4.5 Archived Pipeline

Archived Pipeline (the page address is still /talent-pool) is where candidates land after being Held for Future consideration or Rejected/Withdrawn — a searchable archive rather than a dead end. It's a table, not a card grid — one row per candidate and application, so a candidate with more than one past application shows their full history here (every application they've ever had, not just the one that put them in this pool), not collapsed onto a single row.

Who can access this

- Every persona can browse Archived Pipeline and see everyone in it.
- Only HR/Admin, Leadership, and Super Admin can "Reactivate" a candidate onto a different role.

Key things to understand

Two tabs — "Hold for Future" (candidates parked as a good-but-not-right-now fit) and "Archived" (Rejected or Withdrawn candidates, shown together under one tab). A candidate is listed under a tab when at least one of their applications matches; all of their applications are shown, each with its own status.

Column layout — Candidate, Role, Stage, Status (this row's actual application status — why it's in this pool), Fit, CTC → ECTC, Notice, Preferred Location, Company / Industry, Resume Link, Application Date (days since applied), Last Updated (when this row last had activity — the same figure Active Candidates shows as Last Updated), and Actions. Reactivate is a per-row action, not a single candidate-level button — click the one next to the specific application/row you want to move to a new role. The count at the top counts candidates, not rows, and 50 candidates load at a time — use Load more for the rest.

Search & filters — Search by name, email, or phone, plus a free-text Tag filter, a Gender filter (Male, Female, Not tagged) and the same Department/Location/Role filters used elsewhere in HMS. The Skills and Industry filters match only skills and industries stored on a candidate's profile, which nothing in HMS fills automatically, so they usually find no one — use Search or Tag instead.

Step by step

Find and reactivate a previously parked candidate (HR/Admin, Leadership, Super Admin)

1. Open Archived Pipeline and choose the Hold for Future or Archived tab.
2. Use search/filters to find the candidate — remember they may appear as more than one row if they have multiple past applications.
3. Click "Reactivate" on the row for the candidate you want, pick one of the Live – Sourcing roles they haven't applied to yet, and confirm — this creates a fresh application for that role, starting at Applied and Screened and scored by ResumeIQ, without re-entering their profile; the archived application stays as it was.

Good to know: A candidate lands here purely based on their application status — it doesn't matter which pipeline stage they were at when Held or Rejected. Hold for Future applications also stay visible on Active Candidates; Rejected and Withdrawn ones appear only here.

4.6 Interviews, Assignments & Reference Checks

Covers everything after a candidate is shortlisted: scheduling interview rounds, capturing structured feedback, sending and grading take-home assignments, and recording reference checks — with two built-in checks that stop a candidate advancing without the required evaluation on file.

Who can access this

- HR/Admin, Leadership, and Super Admin can schedule interview rounds, send/retry assignment emails, and add reference checks.
- Whoever is specifically listed as the interviewer for a round can submit feedback for it — this is an exact email match on that specific round, not tied to persona. If a round has no interviewer specifically assigned (normal for Assignment rounds), feedback on it is open to anyone. HR-tier users can submit feedback on any round.

Key things to understand

Standard vs. Assignment rounds — A Standard round is a real interview — scheduling it, with a date and interviewer emails filled in, automatically sends a Google Calendar invite from your own calendar to the interviewers, the candidate (if they have an e-mail on file) and hr@digitalpaani.com. An Assignment round is a take-home exercise — there's no separate "schedule" step; sending the assignment creates the round and emails the candidate in one action. "Schedule Round" is offered while the application is at Interview Round 1, Interview Round 2 or Founders Round.

Assignment emails — Sent from hr@digitalpaani.com with the assignment link, deadline context, and any supporting documents, using whatever mail body you write. If the send fails for any reason, a Retry option appears — the round itself is never lost. The candidate needs an e-mail address on file. The 60-hour submission deadline starts when the e-mail goes out; HMS cannot see the candidate's reply, so when the work comes back HR clicks Record submission and pastes the link, and until then Assignment deadline breached is raised once 60 hours have passed. An outcome of Rejected does not reject the candidate — HR still changes the status.

Feedback capture — For a Standard round: score each area you assessed from 1 to 5, pick an overall assessment, confidence level, and a recommendation (Proceed, Proceed with Concerns, Hold or Reject). For an Assignment: score five weighted criteria (Technical Accuracy 40%, Problem Solving 25%, Clarity & Structure 15%, Practical Thinking 10%, Completeness 10%, each out of 5) and record an outcome (Approved for Next Round / Assignment Resent / Rejected).

Auto-advance on positive feedback — on an Interview Round 1, Interview Round 2, Founders Round, or Assignment Round, submitting feedback that's genuinely positive — Proceed or Proceed with Concerns on a Standard round, or Approved for Next Round on an Assignment, each with an average score above 2.5 — automatically moves the candidate to the next stage the instant you submit it. No separate "advance" click needed. This only fires while the candidate is still sitting at that exact stage and still Active; a toast confirms it when it happens. It moves the candidate one step along the pipeline; a Hold, Reject, Assignment Resent or Rejected result, or a low score, never moves anyone and never rejects or holds the candidate either — HR still changes the status.

Reference checks — A short form — reference's name, phone number, their relationship to the candidate, and an overall feedback rating — logged against the application.

Step by step

Schedule a Standard interview round (HR/Admin, Leadership, Super Admin)

1. From the candidate's application, click "Schedule Round."

2. Enter the round name, at least one interviewer email, and the date/time (India time); meeting mode and duration are optional.
3. Submit — a Google Calendar invite is sent automatically to the interviewer(s), the candidate, and HR.

Good to know: If the calendar invite fails to send for any reason, the round is still created — it just won't have a calendar event attached, and this is now shown directly on the round itself (a "⚠ Calendar invite failed" warning, with the reason on hover) rather than failing silently. This never blocks scheduling.

Submit interview feedback (the interviewer assigned to that round, or anyone if no one specific was assigned)

1. Open the round's feedback form from the candidate's profile.
2. Score each evaluation area, then set Overall Assessment, Confidence, and Recommendation — all three are required before you can submit.
3. Optionally add strengths observed, concerns, and any unresolved questions.
4. Submit — this immediately clears the round from anyone's "feedback due" list and unblocks the candidate from advancing (once every round on their application is fully submitted). If the feedback is positive enough (see above), the candidate also advances to the next stage automatically, right then.

Send a take-home assignment (HR/Admin, Leadership, Super Admin)

1. Click "Send Assignment" — the Assignment Link field is usually pre-filled from the role's saved link.
2. Add any CC recipients, supporting documentation links, and the mail body.
3. Submit — this creates the round and sends the email to the candidate in the same action.

Good to know: If sending fails, a Retry button appears on that round — it reopens the same form pre-filled with your last attempt.

Record and grade a take-home assignment (record submission: HR/Admin, Leadership, Super Admin; record outcome: any persona)

1. HR-tier users first click "Record submission" and paste the link to what the candidate submitted — this is required before grading.
2. Open "Record outcome," score all five weighted criteria and choose an outcome.
3. Submit — this satisfies the same feedback requirement as a Standard round's feedback, and (if the outcome and score are positive enough) auto-advances the candidate the same way.

Add a reference check (HR/Admin, Leadership, Super Admin)

1. From the application — the button appears while it is at the Reference Check stage, and only for HR/Admin, Leadership and Super Admin — click "Add reference check."
2. Fill in the reference's name, phone number, relationship to the candidate, an overall rating, and optional call notes.
3. Submit — once at least one reference check is on file, the candidate can move past the Reference Check stage.

Good to know

- A candidate can't advance past a stage while any of their scheduled rounds still has feedback outstanding — even an old round from earlier in the process. If a candidate seems stuck, check for a forgotten round with pending feedback.
- Leaving the Reference Check stage requires at least one reference check on file first.
- Neither check can be skipped from the screens today; if a candidate genuinely has to move on without one, ask the HMS admin team.

4.7 Agencies

The Agency Repository tracks the recruitment/staffing agencies DigitalPaani works with — contact details, contract terms, commission tiers, and how many candidates each agency has submitted versus actually placed.

Who can access this

- HR/Admin, Leadership, and Super Admin only — this entire section (including the nav link) is invisible to Hiring Managers.

Key things to understand

Agency record — Contact details, contract status (Active/Inactive/On Hold — for reference only: it doesn't block anything, and every agency can still be picked as a candidate's Sourcing Agency), the kinds of roles it specialises in (Requirement Type), up to three commission tiers, and a replacement guarantee period.

Hires and submissions — the list shows each agency's Hires: the number of candidates sourced through that agency (their Source is set to Agency) who have an application at Offer Accepted or Joined, counted once per candidate. An agency's own page also shows Submitted — applications linked to the agency, excluding Rejected and Withdrawn — an older field that no current screen sets, so it may read 0 for recently added candidates; Hires is the reliable figure. Hover the (i) icons on Hires, Commission Tiers, Replacement, and Billing and Payment terms for exactly what each one counts.

Step by step

Review an agency's performance and edit its details (HR/Admin, Leadership, Super Admin)

1. Open Agencies to see every agency with its status, commission tiers, submissions, and hires at a glance.
2. Click into an agency for the full record, and edit any section inline — contact, contract, commission tiers, or notes.

Good to know: The "Add agency" button doesn't currently do anything — if you need a new agency added, contact the HMS admin team directly rather than trying that button.

4.8 User Management (Super Admin only)

The only place in HMS where a user account is created, edited, or deactivated. This is the one page in the entire system that actively blocks anyone else from opening it at all.

Who can access this

- Super Admin only. Every other persona is redirected straight back to the Dashboard if they try to open this page, and the nav link itself is invisible to them.

Key things to understand

No self-signup, ever — A Google account can never create itself a place in HMS — someone must already exist here, added by the Super Admin, before they can sign in for the first time.

Deactivation is always reversible — Removing someone's access sets their account to inactive rather than deleting it, since their past actions (interview feedback, activity history, etc.) stay attached to their name permanently. A deactivated person is signed out on their very next request (see Getting Started), not only when their 24-hour session ends.

A built-in safety net — The Super Admin cannot change their own role or deactivate their own account through this page — by design, so nobody can ever accidentally lock everyone out at once.

Names matter — a user's Name must match what HR writes in a role's Hiring Manager field (whole name, ignoring case), or that person will not get the Hiring Manager view of the role. The Add and Edit forms also take an optional Department, and the list shows each person's last sign-in and whether they are active.

Step by step

Add a new user (Super Admin)

1. Open User Management and click "Add user."
2. Fill in their name, @digitalpaani.com email, and role (HR/Admin, Hiring Manager, or Leadership — Super Admin itself is never offered here).
3. Submit — they can now sign in with Google using that exact email.

Deactivate or reactivate a user (Super Admin)

1. Find the person on the User Management list.
2. Click Deactivate (or Reactivate, if they're currently inactive) — the person is signed out on their next click or page load (within about 15 seconds at most) and cannot sign in again until reactivated.

Good to know: By policy, there is deliberately only ever one Super Admin account in HMS.

4.9 Sourcing Execution & Accountability

Sourcing used to be reactive: nobody could say, for a thin role, which channels had been used or what had been promised. This module gives every open role a sourcing plan — the channels HR will use, with dated tasks and weekly targets for each — and raises an exception when something that was promised is not done. It has a page of its own — Sourcing, in the sidebar right after Roles — where each role's whole plan is shown, one role at a time; a summary section at the bottom of the Dashboard shows what is slipping across roles, and the to-do list is in My Tasks. It appears only while the module is switched on; until then none of what follows is visible, including the sidebar entry.

Who can access this

- Every persona sees Sourcing in the sidebar while the module is on. HR/Admin and Super Admin can do everything, on every role's plan, and have the Sourcing box in My Tasks. Leadership has the same write rights and, with the Super Admin, can change the module's thresholds and e-mail settings (there is no screen for this yet — ask whoever maintains HMS); Leadership sees every plan on the Sourcing page and the Dashboard's Sourcing execution section, but has no My Tasks box.
- Sourcing is owned by HR/Admin as a whole, not by a person: a plan has no individual owner (the plan says "Owner: HR"), and every HR user sees the same queue and can act on any plan.
- A role's Hiring Manager sees a read-only, partly redacted view of the plan on their own role, on the Sourcing page ("View only"): no strategy note, post links, closure reasons, plan history, recommended next steps, completion notes or exception reasons, and no provisional signals — but a channel's excluded reason, its weekly results and an exception's resolution path and dates are still shown. A Hiring Manager of another role sees nothing.

Key things to understand

Plan — one per role: Draft → Active → Paused (role On Hold) → Closed. A draft is created automatically for every Approved or Live – Sourcing role and is not tracked; activating it is the commitment moment. A closed plan is finished: closing a role skips its open tasks and clears its alerts, and nothing else is queued. While a role is on hold its plan is paused: the weekly trackers stop (the week in progress is kept as "cut short") and start again the day the role is back, and open due dates move out by the whole days on hold.

Channels — LinkedIn, Naukri/IIMjobs, Agency, Internal Referral and Direct Outreach. Each is Not live yet, Live, Closed (stopped, with its history kept), or Not used (left out with a written reason). LinkedIn, Naukri/IIMjobs and Direct Outreach are also tracked weekly (below). The role's Recruitment Mode field becomes read-only once a plan exists — the plan manages channels: one you add, bring back or reopen there is added to the role's Recruitment Mode too, while closing a channel leaves the role's list as it was.

Tasks — activating a channel creates its first task: log the LinkedIn or Naukri/IIMjobs post with its link and weekly sourcing target (due 1 working day later); brief the agencies (2); launch the referral push (1); log the Direct Outreach campaign with its link and weekly target (2). Completing it creates the follow-ups: renew a portal posting before it expires (every 30 days, due 3 days before), follow up with agencies (weekly), and repost to employees (every 14 days). A task is overdue only after its due day ends. Working days are Monday to Friday; public holidays are not modelled.

Weekly tracker — for LinkedIn, Naukri/IIMjobs and Direct Outreach, logging the post needs a link and a weekly sourcing target: how many applicants, qualified and unqualified together, the channel should bring in each week. From that day HMS counts the applications to the role whose answer to "How did you hear about this opening?" on the Job Application Form is that channel, and at the end of every 7-day week adds a line to the channel: green "Met" if the count reached the target, red "Missed" if not. Nothing is typed in. The week in progress shows live, the tracker runs until the channel is closed, and a changed target never rewrites weeks that already finished. A week cut short — the channel was closed, or the role put on hold — is listed but is neither met nor missed.

Qualified-candidate target — each role has its own weekly target of qualified candidates (1–500). The default is 5 for P0 and P1 roles; a P2 or P3 role has none until HR sets one. It is set when the plan is activated or later with "Edit plan", and is separate from each channel's weekly sourcing target.

Closing a channel — "Close channel" (with a short reason) stops the channel's open tasks and nothing more is chased for it. The post link, targets and every weekly result stay on the plan as a summary. "Reopen channel" brings back its follow-up tasks and restarts the weekly tracker from that day (the next day if it was closed the same day).

Recommended next steps — under each item in Needs attention, a "Next" box gives concrete steps (which channel, what to do, by when). They are written by an AI model from the role's target, the pipeline as counts, each channel's weekly results and the open problems — no candidate names or contact details are

shared with it. If the AI is unavailable, rule-based steps are shown and labelled. Only HR/Admin, Leadership and Super Admin see them.

Plan history — every action on the plan, newest first, with who did it: tasks done or skipped, channels added, closed or reopened, target changes, problems resolved or put off, and strategy note edits. HMS adds its own entries too (marked "System"): a problem it flagged or saw clear by itself, and the result of each finished tracker week. Only HR/Admin, Leadership and Super Admin see it.

Exceptions — what was promised and did not happen: Plan not activated (a role approved more than 1 working day ago), Channel set-up overdue, Task overdue, Follow-up overdue, Not enough qualified candidates (an open role with fewer qualified candidates in the last 7 days than its target — 5 unless set otherwise — on each of the last 5 working days), and Blocker overdue. "Qualified" means shortlisted by a person or scored above 60 by ResumeIQ — both parts are always shown.

Provisional signals — for the first 6 weeks after the module is switched on, threshold signals such as "not enough qualified candidates" are provisional: HR/Admin, Leadership and Super Admin see them greyed on the Dashboard and the Sourcing page, but they raise no tasks, appear in no e-mail and cannot be resolved.

Resolving an exception — every live exception is answered one of three ways: "I'll catch up" (a reason and a date within 14 days; it comes back if still true), "Change the plan" (a reason; optionally close the channel), or "I'm blocked" (a reason, who must unblock it and a deadline within 60 days).

Attribution — "Applications by source" on a role's plan counts applicants by their answer to "How did you hear about this opening?" on the Job Application Form (LinkedIn, Naukri/IIMJobs, DigitalPaani HR Outreach, Hiring Agency or DigitalPaani Employee Referral); the same answers drive the weekly trackers. An applicant who skips the question shows as "Not tagged" and counts toward no channel, and anyone who applied before the question existed is not tagged either. It is the applicant's own answer, so treat it as a claim; a source with fewer than 5 applications is marked as too small to judge.

Step by step

Activate a role's sourcing plan (HR/Admin, Leadership, Super Admin)

1. Open Sourcing in the sidebar and pick the role — a role waiting for a plan is listed under "Plans waiting to be activated" — or click the role in My Tasks → Sourcing → Plans to activate. A role's own page also has a Sourcing chip that opens its plan.
2. Click "Activate plan." Tick the channels you will use, and optionally set this role's weekly qualified target. For each one that is already running, tick "Already running before today" and enter the posting date — it is recorded as done, so it does not show as overdue, and the renewal reminder counts from that date. For LinkedIn, Naukri/IIMjobs and Direct Outreach also give the post link and the weekly sourcing target.
3. Untick a suggested channel only if you give a reason. Add a strategy note if leadership should know your approach (the Hiring Manager does not see it).
4. Click "Activate plan." The clocks start today.

Work the plan day to day (HR/Admin, Leadership, Super Admin)

1. Open My Tasks → Sourcing: Plans to activate, Due today, and Needs attention, grouped by role — the same list for everyone in HR.
2. Click "Mark done" on a task (add a link or note if useful), "Skip" with a reason, or "Undo skip" to bring it back (a skipped follow-up is due tomorrow; a skipped first task gets its normal 1–2 working days).
3. On the role's plan, use "Add channel" or "Bring back" to add a channel mid-flight (its first task falls due in 1–2 working days), "Close channel" (with a reason) to stop one — it stays on the plan as a summary and can be reopened — "Edit target and link" to change a live channel's weekly target or post link, and "Edit plan" to change the strategy note and the role's weekly qualified target.
4. For each item under Needs attention, read the Next box for the recommended steps, then click "Resolve…" and choose catch up, change the plan, or blocked.

Good to know

- A role going On Hold pauses its plan and stops its clocks; when the role comes back, every open due date moves out by the whole days it was paused, and the weekly trackers start again that day. Closing a role closes the plan; reopening the role returns it to a draft that must be activated again.
- The Dashboard's last section is "Sourcing execution" (a summary and an exceptions table across roles: committed / what happened / next action / age); click a role in it to open that role's plan on the Sourcing page, which shows one role at a time with the role switcher at the top. A bookmark or e-mail link made before this move still works: it takes you to the Sourcing page automatically.
- E-mails are off by default. If switched on, HR/Admin receive one daily note when something needs doing, and the configured leadership addresses receive a Monday summary.
- A task cannot be marked done if it was skipped, or belongs to a channel that is left out, closed, or on a closed plan — undo the skip, or bring the channel back or reopen it, first.

5. Persona-by-Persona Quick Reference

A condensed checklist for each role — everything above, organized around what you personally do day to day. Use section 4 for full detail on any item below.

5.1 HR / Admin

You have full operational control of the hiring pipeline. Your day-to-day typically includes:

- Create and approve role requisitions (the Approve Role button); monitor JD generation; discard a Draft that is not going ahead (4.2).
- Add candidates manually, or reconcile Unlinked/Unmatched candidates from form submissions (4.3).
- Move candidates through the pipeline — stage and status changes, including rejections and withdrawals with a reason (4.3).
- Review AI-scored candidates and shortlist, hold, or reject them at Applied and Screened (open to everyone, not unique to you) — plus make every other stage/status transition, which stays HR-tier only (4.4).
- Schedule interview rounds, send take-home assignments, grade them, and log reference checks (4.6).
- Manage agency relationships and attribute candidates to the agency that sourced them (4.7).
- Monitor the Dashboard for SLA breaches and aging roles across every owner (4.1).
- Where the Sourcing module is on: activate and run each role's sourcing plan from My Tasks → Sourcing and the Sourcing page in the sidebar (4.9).
- Download a role's closure summary once it's Closed – Filled or Cancelled (4.2).
- Use the Founder Review flag to escalate a candidate to leadership attention outside the normal pipeline.

5.2 Hiring Manager

Your focus is reviewing AI-scored candidates for your own open role(s) and deciding who moves forward, plus interview feedback when you're assigned. Here's what changed for you most recently:

- Your Dashboard — every KPI, chart, and filter on it — is locked to your own open role(s); there's nothing to widen (4.1).
- You now see CTC and expected-CTC figures for candidates and applications linked to your own role(s) — never for any role that isn't yours (Section 3).
- You can submit a role request for a new opening — but you can no longer approve it yourself, even for your own role. Approval is now HR/Admin, Leadership, or Super Admin only (4.2).

And the rest of your day-to-day, unchanged:

- Check My Tasks → Ready for review regularly for candidates who've reached Applied and Screened for your role (4.4). You'll only see candidates for role(s) where you're the listed hiring manager.
- Read the AI score, strengths, and red flags before deciding.
- Shortlist, Hold for Future, or Reject — singly or in bulk (4.4). Note this action is open to every persona, not exclusive to Hiring Managers — it's simply your main day-to-day use of it.

- Submit interview feedback for any round you're specifically listed as the interviewer on — a genuinely positive result now automatically advances the candidate the moment you submit it (4.6).
- Browse Archived Pipeline to see candidates previously held or rejected for your role (view-only — you cannot reactivate them yourself).
- You do not have access to: editing or approving any role at all (including your own), Agencies, or User Management.
- Your name on a role comes from HR writing it in the role's Hiring Manager field, and it must match your HMS user name (whole name, ignoring case) — otherwise you will not get the Hiring Manager view of that role (4.2).
- Where the Sourcing module is on, you see your own roles' sourcing plans, read-only, on the Sourcing page in the sidebar (4.9).

5.3 Leadership

You see and can do everything HR/Admin can — full pipeline access, full compensation visibility, and every action described in Section 4 for HR/Admin applies to you too (your permissions are deliberately identical). The differences:

- The Stage badge in the Ready-for-review table is a clickable "jump to any stage" link for you and the Super Admin; HR/Admin move stages from the candidate's page (4.4).
- On Roles, your button reads Request role rather than New role. It creates the same kind of Draft, and you can approve roles yourself, like HR/Admin (4.2).
- On My Tasks → "Ready for review," you see candidates flagged for Founder Review — plus the candidates of any role you are the named Hiring Manager of — not the full company-wide list HR/Admin see (4.4).
- Use the Dashboard's Aging Roles and Hiring Funnel Snapshot for oversight across the whole team, and act on Founder Review escalations raised by HR.
- You, with the Super Admin, change the Sourcing module's settings. You have no Sourcing box in My Tasks, but you see every plan on the Sourcing page in the sidebar and the Sourcing execution section on the Dashboard (4.9).

5.4 Super Admin

By policy, exactly one person holds this persona. You have every capability Leadership has, plus one exclusive responsibility:

- User Management — the only way anyone gets added to, edited in, or removed from HMS (4.8).
- Your My Tasks "Ready for review" list is unfiltered and company-wide, like HR/Admin's — not scoped to Founder Review flags the way Leadership's is.
- Everything else — roles, candidates, scoring, interviews, agencies, the Sourcing page, and the Sourcing box in My Tasks — you use exactly as HR/Admin/Leadership would.

6. Glossary & ID Reference

Every record in HMS has a short, prefixed ID you'll see throughout the system — in URLs, activity logs, and on-screen.

Prefix	What it identifies
R###	Role (requisition)
C####	Candidate (one row per person)
A####	Application (one candidate's pipeline record for one role)
IR####	Interview round (Standard or Assignment)
AGN###	Agency
RC###	Reference check
Q###	Interview evaluation question (question bank)
BEN###	Compensation benchmark band

Pipeline stages (an application's Stage field)

In order: Applied and Screened → Interview Round 1 → Interview Round 2 → Assignment Round → Founders Round → Reference Check → Pre-Joining Documents → Offer Discussion → Offer Released → Offer Accepted → Joined. Every application is scored by ResumeIQ automatically at Applied and Screened and can be shortlisted straight into Interview Round 1 from there — "Resume Review" and "Shortlisted" no longer exist as separate stages.

Application status values

- Active — currently progressing normally.
- Rejected — turned down, with a reason on file.
- Withdrawn — the candidate pulled out, with a reason on file.
- Hold for Future — a good fit, parked for a future opening.
- Joined — successfully hired and onboarded.
- Closed — a legal status value, but nothing sets it today (closing a role does not change its applications).

Priority levels

P0 is the most urgent, P3 the least — priority drives both aging-alert thresholds on the Dashboard and general sourcing urgency.

Scores

ResumeIQ Average Score — the average of the 8 dimensions (plus Portfolio where the role has one), out of 10. Fit — the same figure out of 100: ten times the Average Score, so a Fit of 74 is an Average Score of 7.4. Fit appears on Active Candidates and Archived Pipeline and drives the Dashboard's "Fit score ≥75 / ≤45" counts; a Fit of 75 or more is the high-scored tier that gets the tighter 24-hour SLA windows.

SLA breach types (Hiring Funnel Snapshot / SLA Breaches KPI)

- Idle Candidate (HR) — no stage change in 48h+ (Reference Check, Pre-Joining Docs, Offer Discussion, Offer Released).
- Resume Shortlist Pending (Hiring Manager) — not shortlisted within 48h of reaching Applied and Screened (24h if the ResumeIQ fit score is 75 or more).
- Interview/Founders Round Not Scheduled (HR) — no round with a date booked within 48h of entering that stage (24h if fit score ≥ 75).
- Assignment Not Sent (HR) — assignment not sent within 48h of entering Assignment Round (24h if fit score ≥ 75).
- Interview/Founders Feedback Due (Hiring Manager) — feedback not submitted within 48h of the interview's scheduled time (24h if fit score ≥ 75).
- Assignment Feedback Due — HM hasn't submitted feedback within 96h of the assignment being sent.
- Assignment deadline breached (HR) — the candidate has not submitted within 60h of the assignment being sent.
- Joining risk — no contact (HR) — a candidate at Offer Accepted whose last logged HR contact is more than 5 days old, or who has none logged (flagged at the next check). There is no screen for logging HR contact yet, so it clears when the candidate joins or leaves Active.
- Feedback Overdue — Leadership Escalation (Leadership) — a Standard-round Feedback Due breach still open 96h after the interview raises a second, Leadership-owned alert; the original stays open until feedback is submitted.

Sourcing terms

- Plan — a role's sourcing strategy: its channels and dated tasks. Owned by HR/Admin as a whole.
- Channel — LinkedIn, Naukri/IIMjobs, Agency, Internal Referral or Direct Outreach.
- Task (commitment) — a dated piece of sourcing work on a channel, such as publishing a posting or following up with agencies.
- Exception — something promised and not done; it must be resolved as catch up, change the plan, or blocked.
- Provisional signal — a new threshold signal still being calibrated; visible to HR/Admin, Leadership and Super Admin only, with no tasks or e-mails.
- Qualified — shortlisted by a person, or scored above 60 by ResumeIQ.
- Weekly sourcing target — how many applicants (qualified and unqualified) a LinkedIn, Naukri/IIMjobs or Direct Outreach channel should bring in each week; set when its post is logged.
- Weekly result — Met (green) or Missed (red): the applicants who named that channel on the application form during the week, against its weekly sourcing target.
- Qualified target — a role's own weekly target of qualified candidates; 5 by default for P0 and P1 roles.
- Blocker — a reason, outside sourcing, why a task cannot be done; it names who must unblock it and by when.

Portfolio review terms

- Portfolio (ninth dimension) — the 0–10 score from the separate portfolio or work-sample review, added to the 8 ResumeIQ dimensions for the Senior UX/Product Designer and Head of Marketing & Creative Direction roles.
- Not scored — a Head of Marketing review that found no work it could really look at or assess; the Portfolio dimension is left out and the overall score is the average of the 8 ResumeIQ dimensions. Never a 0 and never held against the candidate.

- Work sample — a link to the candidate's own work (a deck, case study, campaign, website, image or video) in their application answer.
- Coverage — the line on the Portfolio review card that says how much of a link was really read: "Reviewed" or "Partly" for the links under "Work reviewed"; a link that could not be read is listed once under "Not reviewed — open these by hand" with its reason, for example "Not opened: social platform".
- Confidence — High, Medium or Low: how well the work that could be reviewed supports the Portfolio score.

7. Frequently Asked Questions

"Your account is not registered in HMS" — what do I do?

Nobody has added your account yet. Google sign-in can never create an HMS account by itself — contact the Super Admin (Aaron Newton) to have your @digitalpaani.com account created first, then try signing in again.

Why can't I see CTC, compensation, or agency fee figures?

These fields are restricted to HR/Admin, Leadership, and Super Admin everywhere, plus — for their own role's candidates and applications only — the Hiring Manager who owns that role. If you're a Hiring Manager looking at a candidate for a role that isn't yours, not seeing these figures is expected behavior, not a bug.

Why is my Dashboard's Role filter missing / locked?

If you're a Hiring Manager, your whole Dashboard — every KPI, chart, and filter — is scoped to your own open role(s) by design and can't be widened; a "Locked to your role" badge appears where the Role filter would otherwise be. HR/Admin, Leadership, and Super Admin get the full, adjustable set of master filters instead.

Why can't I approve my own role anymore as a Hiring Manager?

Role approval is now restricted to HR/Admin, Leadership, and Super Admin only — the earlier ability for a Hiring Manager to approve their own requested role has been removed. Ask HR to approve it once it's ready.

Why did adding a new candidate take so long?

That pause (typically 15–30 seconds) is HMS's AI actually reading the candidate's resume from Google Drive and scoring it against the role in real time, the moment the application is created — it only happens once per application, automatically, with no manual step needed.

A candidate I gave positive interview feedback on jumped to the next stage by itself — is that a bug?

No — that's the auto-advance rule. Submitting genuinely positive feedback (Proceed or Proceed with Concerns on an Interview/Founders round, or Approved for Next Round on an Assignment, each with an average score above 2.5 out of 5) now automatically moves the candidate to the next stage the moment you submit it, to save an extra manual click. A toast confirms it happened.

The system won't let me advance a candidate — why?

Two checks commonly block this: any of their scheduled interview/assignment rounds still has feedback outstanding, or (if they're leaving the Reference Check stage) there's no reference check on file yet. Resolve the missing item, or ask HR/Leadership about an override if there's a genuine exception.

How do I get a summary of a role once we've filled or cancelled it?

Open the role once its status is Closed – Filled or Closed – Cancelled, and click "Download Closure Summary" on its detail page — a one-page PDF with the full pipeline funnel, every SLA breach it accumulated, source-channel quality, and how long it took to close.

A role I approved a while ago shows no Role Age, or it shows OK/unflagged once I put it On Hold — is that a bug?

No — Role Age keeps ticking only while a role is Approved or Live – Sourcing. On Hold roles still appear in the Aging Roles table for reference, but always show as OK, since the clock isn't running while paused. Draft and

Under Review haven't started the clock yet. Moving a role back to Live – Sourcing resumes it against the same Open Date it was originally approved on.

The Source Quality channels on the Dashboard look different from what I remember — what changed?

Source Quality now reports each candidate's own Source field (Naukri/IIMjobs, LinkedIn, Internal Referral, Agency, Direct Outreach) instead of an older, separate application-level field that stopped being collected a while back. If a channel name you used to see is gone, it's because it was retired from that older vocabulary, not because the data disappeared.

A candidate I rejected/withdrew has disappeared from Active Candidates — where did they go?

Nothing was deleted. Rejected and Withdrawn applications never appear on Active Candidates; they are in Archived Pipeline, which is searchable the same way.

Does HMS e-mail me a daily summary of pending items?

No — HMS does not currently send a daily pending-items e-mail. The only daily e-mail that can exist belongs to the Sourcing module: it is off by default and, if switched on, sends one note to HR/Admin on weekdays when something needs doing. HMS does send Google Calendar invites for interviews, assignment e-mails, and the optional rejection e-mail.

The "Add Agency" button on the Agencies page doesn't do anything when I click it — is that broken?

Yes — this is a known, currently-unwired button. If you need a new agency added to the system, contact the HMS admin team directly rather than using that button.

Who do I contact for account or access issues?

The Super Admin, Aaron Newton, is the only person who can create, edit, or deactivate an HMS account, or change anyone's persona.

I was suddenly sent back to the sign-in page — why?

Either your 24-hour session ended, or the Super Admin deactivated your account. HMS checks on every request that your account is still active, so a deactivated person is signed out on their next click or page load, within about 15 seconds at most. If you think it is a mistake, contact the Super Admin to have your access restored.

Does HMS prepare offer letters or a pre-joining document checklist?

No. Reference Check, Pre-Joining Documents, Offer Discussion, Offer Released (records the offer date), Offer Accepted (records the date used for Time to Fill) and Joined are stages HR moves by hand; the offer letter and the documents themselves are handled outside HMS today.

Why don't I see a role when I add a candidate or link someone to a role?

Add candidate, Add Application, Link to role and Reactivate offer only roles whose status is Live – Sourcing — and, for someone already in HMS, only roles they have not applied to. An Approved role is not offered until HR/Admin, Leadership or Super Admin set it to Live – Sourcing on the role's page.

Why was I asked for a reason before shortlisting a candidate?

When a candidate's expected CTC is 15% or more above the top of the role's CTC band, HMS requires an on-record reason before they can be moved to Interview Round 1 — from Ready for review, the Stage button or a bulk stage change, whoever is doing it (a Hiring Manager is asked too, even though the band itself is hidden from them). If the band or the expected CTC is not recorded, no reason is asked for.

Does the AI decide who moves forward?

No. People make every decision: nothing in HMS moves, rejects or hires a candidate because of an AI score. A ResumeIQ fit of 75 or more only gives a tighter 24-hour SLA window, and the Portfolio score is part of the average. See "What the AI sees, and who decides" in section 4.4.

Who owns a role's sourcing plan?

HR/Admin as a whole. A plan has no individual owner: everyone in HR sees the same Sourcing queue in My Tasks and can complete, skip or resolve anything on any plan.

Where did the Sourcing card on the role page go?

It moved to its own page. Open Sourcing in the sidebar (right after Roles), pick the role at the top and you get its whole plan; the role's own page now shows only a chip that opens it. (For a short while it was a section at the bottom of the Dashboard; links to that section now take you to the new page.)

What does "Close channel" do, and can I undo it?

It stops the channel's open tasks, so nothing more is chased for it. The post link, targets and every weekly result stay on the plan as a summary. "Reopen channel" brings its follow-up tasks back and restarts the weekly tracker from that day (the next day if it was closed the same day).

Where do the recommended next steps come from?

An AI model is given the role's target, the pipeline as counts, each channel's weekly results and the open problems — never candidate names or contact details — and writes concrete steps. They are reused for up to a day while the numbers are the same, "Refresh" asks again, and rule-based steps appear if the AI is unavailable.

I'm a Hiring Manager and I can't see my role's compensation or my role's work — why?

Your HMS user name must match the name HR wrote in the role's Hiring Manager field (whole name, ignoring case). If the role says only a first name, or spells it differently, you will not be recognised as its Hiring Manager. Ask HR to correct the role, or the Super Admin to correct your user name.

Where does a Hiring Manager shortlist a candidate?

In My Tasks → Ready for review, on candidates at Applied and Screened. There is no shortlist button on the Active Candidates page.

Sourcing isn't in my sidebar — why?

The Sourcing page and its sidebar entry, and the Dashboard's Sourcing execution section, appear only while the Sourcing module is switched on for HMS (opened directly while it is off, the page says "Sourcing is switched off"). Leadership have no Sourcing box in My Tasks (they use the Sourcing page and the Dashboard's Sourcing execution section), and a Hiring Manager sees their own roles' plans read-only.

What does "Provisional" mean on a sourcing signal?

A new signal, such as "not enough qualified candidates," that is still being calibrated for its first 6 weeks. HR/Admin, Leadership and Super Admin can see it greyed out, but it raises no tasks, sends no e-mail and cannot be resolved yet.

Why does a Head of Marketing candidate's Portfolio say "Not scored"?

Because there was nothing the review could really look at: no answer or "N/A", a written description with no link, a private or deleted link, links on LinkedIn, Instagram or video only, a site that blocks automated viewing, or work it could not assess at all (unreadable, or in a language it cannot judge). It is not a mark against the candidate and not a 0 — the overall score is simply the average of the 8 ResumeIQ dimensions. Open the Portfolio review card on the candidate's page: it gives the reason and lists the links to open by hand. For a private link, ask the candidate to share it so that anyone with the link can view it, then press Re-run.

Does the Portfolio review watch videos or open LinkedIn?

No. YouTube and Vimeo links are judged from the title, description and thumbnails only, an Instagram link from its public caption, and LinkedIn is never opened. Those links are listed for you to open by hand, and a candidate whose only samples are videos or social profiles is not scored.
